Lake Winnebago is at 3.00 ft this morning after a week of declining levels and flows. The rainfall yesterday had little impact on the basin as a whole, but unsettled weather and humid air bring the potential for storms to cross the basin this weekend. Rainfall forecasts show a potential for 1.5" of rainfall but unstable weather may result in significant areas of the basin remaining dry.

Inflows to the lake have steadily declined and are now near 3,600 cfs despite rain yesterday. The gates at the Neenah Dam were closed Monday and the last gate at the Menasha Dam was closed Wednesday. The upstream gages are also continuing to decline as the basin has dried over the last week.

Outflows over the uncontrolled spillways at the Neenah and Menasha Dams were around 1,700 cfs this morning. With all the gates closed, the water level of Lake Winnebago in the coming days will be dependent on whatever rainfall occurs in the basin.

Please check this page for weekly updates regarding basin conditions and gate movements.
